| Question | Answer | Marks |
| :---: | :---: | :---: |
| 1 | D | 1 |
| 2 | C | 1 |
| 3 | C | 1 |
| 4 | $\begin{aligned} & \text { Energy }=\frac{1}{2} \times 5 \mathrm{~N} \times 0.09 \mathrm{~m} \\ & =0.2 \mathrm{~J} \end{aligned}$ | $1$ |
| 5 a | Taking the gradient of the linear section of the graph $\frac{140 \mathrm{MPa}-0 \mathrm{MPa}}{0.005}$ $280000 \mathrm{MPa}\left(2.8 \times 10^{11} \mathrm{~Pa}\right)$ | $1$ |
| 5 b | The non-linear section shows plastic deformation. | 1 |
| 6 a | Brittle material fracture with little plastic deformation and break into sharp fragments | $\begin{array}{\|l} \hline 1 \\ 1 \\ \hline \end{array}$ |
| 6 b | Any reasonable example, for example: a wine glass | 1 |
| 6 c | Any reasonable example of a material and a situation in which toughness is important, for example steel. In crumple zones. | $\begin{aligned} & 1 \\ & 1 \\ & \hline \end{aligned}$ |
| 7 | Cross-sectional area of wire $=2.8 \times 10^{-6} \mathrm{~m}^{2}$ <br> Radius of wire $=9.44 \ldots \times 10^{-4} \mathrm{~m}$ <br> Diameter $=1.9 \times 10^{-3} \mathrm{~m}$. <br> Examiners will give full credit for correct final answer | $\begin{aligned} & \hline 1 \\ & 1 \\ & 1 \end{aligned}$ |
| 8 a | The graph is a straight line through the origin. | $\begin{array}{\|l\|} \hline 1 \\ 1 \\ \hline \end{array}$ |
| 8 b | Choosing a data pair from the graph for example $10.0 \mathrm{~N}, 1.1 \mathrm{~mm}$ $\begin{aligned} & E=\frac{\sigma}{\varepsilon}=\frac{F L}{x A} \Rightarrow A=\frac{F L}{x E}=\frac{10.0 \mathrm{~N} \times 1.9 \mathrm{~m}}{1.1 \times 10^{-3} \mathrm{~m} \times 1.8 \times 10^{11} \mathrm{Nm}^{-2}}=9.59 \times 10^{-8} \mathrm{~m}^{2} \\ & \text { Diameter }=2 \times \sqrt{\frac{A}{\pi}}=3.5 \times 10^{-4} \mathrm{~m}(2 \text { s.f. }) \end{aligned}$ | $\begin{aligned} & 1 \\ & 1 \\ & 1 \end{aligned}$ |
| 8 ci | Yield stress is the stress at which plastic deformation begins. Breaking stress is the stress at which the material fractures (breaking stress is often referred to as fracture stress). | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |
| 8 c ii | $\begin{aligned} & \text { breaking stress }=\text { breaking force } \div \text { cross-sectional area } \\ & \frac{18.0 \mathrm{~N}}{9.59 \times 10^{-8} \mathrm{~m}^{2}}=1.9 \times 10^{8} \mathrm{~Pa} \end{aligned}$ |  |
| 8 c iii | Yield strength is important because, for example, a suspension bridge must not yield under its load. Yielding can be just as damaging and dangerous as breaking. | 1 |
| 9 ai | $\%$ uncertainty of extension measurement $=6(.25) \%$ <br> \% uncertainty of length measurement $=0.7 \%$ <br> The extension measurement gives the greatest \% uncertainty. | $\begin{aligned} & 1 \\ & 1 \\ & 1 \\ & \hline \end{aligned}$ |
| 9 a ii | The \% uncertainty can be reduced by using a longer original length of band. <br> The same absolute uncertainty will produce a smaller \% uncertainty because the absolute value of extension will be greater for a given load when using a longer band. |  |
| 9 bi | $E=\frac{\sigma}{\varepsilon}=\frac{F L}{x A}$ Hence, choose the largest possible values for $F$ and $L$, and the smallest possible values for $x$ and $A$. <br> Largest $F=0.505 \mathrm{~N}$ | 1 |

|  | Smallest $A=3.88 \mathrm{~mm}^{-2}=3.88 \times 10^{-6} \mathrm{~m}^{2}$ <br> Largest $L=0.146 \mathrm{~m}$ <br> Smallest $x=0.0075$ <br> Value of $E$ from these values $=2.5(3) \times 10^{6} \mathrm{~Pa}$ <br> $\mathbf{9} \mathbf{b}$ ii <br> percentage uncertainty $=\frac{2.5(3) \times 10^{6}-2.3 \times 10^{6}}{2.3 \times 10^{6}}=10 \%$ | 1 |
| :--- | :--- | :--- |
| $\mathbf{9} \mathbf{b}$ iii | lgnoring the uncertainty in length in the calculation from i gives a result of <br> $2.5(2) \times 10^{6} \mathrm{~Pa}$. This gives a percentage uncertainty of $9.6 \%$, showing that <br> the uncertainty in length contributes very little to the overall uncertainty. | 1 |
